

Meeting of the WQAC

Evaluation of SPW Chloride Data

Delaware River Basin Commission

July 28, 2020

Elaine Panuccio
Water Resource Scientist

Delaware River Basin Commission

DELAWARE • NEW JERSEY
PENNSYLVANIA • NEW YORK
UNITED STATES OF AMERICA

Presented to the joint WQAC meeting on July 28, 2020. Contents should not be published or re-posted in whole or in part without permission of DRBC.

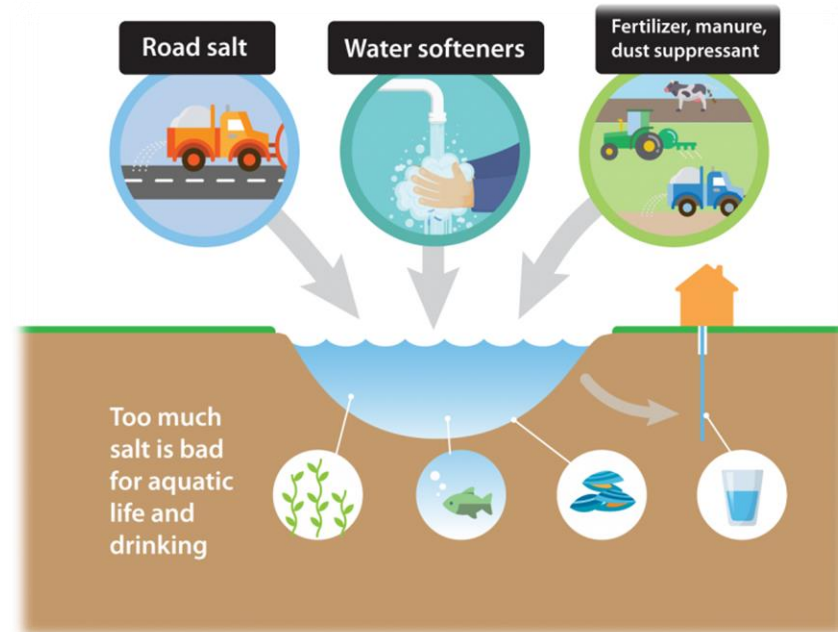

Freshwater Salinization and Increasing Chloride

- ❑ Why did DRBC assess SPW chloride data?
 - ❑ Freshwater salinization as a global concern
 - ❑ Readily available long-term dataset of conventional parameters and nutrients available through Water Quality Portal
 - ❑ Trends in non-tidal Delaware River (SPW watershed) corroborate other assessments
 - ❑ Delaware River at Calhoun Street Bridge captures freshwater inflows to the Delaware Estuary and reflects upstream water quality
 - ❑ Long-term monitoring site of DRBC and USGS

Chloride Culprits

- ❑ Human activity combined with high reactivity and mobilization of chlorides
 - ❑ Increased impervious surfaces and deforestation
 - ❑ Road deicing salt with inconsistent regulation of application
 - ❑ Fertilizers (agriculture, private land)
 - ❑ Wastewater (industrial, municipal)
 - ❑ Water softeners
 - ❑ High-salt diets
 - ❑ Other
- ❑ Compounding effect

<https://www.pca.state.mn.us/water/chloride-101>

Increasing Chloride as a Concern

- ❑ Ecological effects
 - ❑ Toxic to aquatic life at certain thresholds
 - ❑ Increasing salinity, concurrent with increasing chloride concern, may alter water quality dynamics (stratification and nutrient cycling)
- ❑ Mobilization of toxic metals
- ❑ Human health risks – increased salt and heart health
- ❑ Changes to infrastructure
- ❑ Other known, unknown and/or combined effects

Trends of Increasing Freshwater Chloride

Webinar hosted at USGS
Lawrenceville, NJ office

How salty are our streams? Using high-frequency data to characterize chloride exceedance events above ecologically-relevant thresholds

Wednesday, January 8, 2020 at 12:00 pm ET

Presented by:

Rosemary Fanelli (USGS South Atlantic Water Science Center)
and

Joel Moore (Towson University/USGS MD-DE-DC Water Science Center)

Growing Public Awareness

Where will all that road salt go? Into the Delaware River - and that's a concern

The Philadelphia Inquirer

by Frank Kummer, Posted: January 12, 2018

<https://www.inquirer.com/philly/health/environment/where-will-all-that-philadelphia-road-salt-go-in-the-delaware-river-and-thats-not-good-20180111.html>

Local example:

- Dr. Hongbing Sun with Rider University has been featured in the news over the past couple of years by multiple stations regarding his research about road deicing salt impacts

<https://twitter.com/RiderUniversity/status/1093538422042574848>

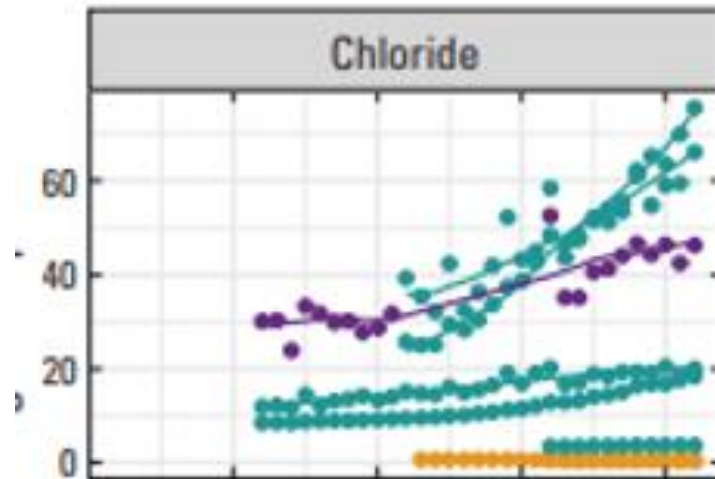

Trends of increasing freshwater chloride

- USGS 2019 pilot regional Integrated Water Availability Assessment (IWAA) covering data from 1972-2012, increases in specific conductance and chloride

Integrated Water Availability Assessments Program

A Historical Look at Changing Water Quality in the Delaware River Basin

Delaware River at Trenton (Calhoun Street Bridge)

Chloride Time Series, Delaware River at Trenton

- Chloride concentrations in non-tidal DR generally not at levels toxic to aquatic life, but the increasing trend is of concern

Special Protection Waters Program

Special Protection Waters: Keeping the Clean Water Clean

- ❑ Adopted in 1992, and designed as an antidegradation program for streams and rivers where existing water quality is better than established standards
- ❑ New and expanding dischargers in SPW area must demonstrate no measurable change to existing water quality to obtain DRBC approval
 - ❑ What is *Existing Water Quality*?

Delaware River Basin Commission

- Readily available via Water Quality Portal (2004-2017)
- National Park Service Upper Delaware and Middle Delaware as monitoring partners (May through September)
- 2,105 individual chloride observations downloaded for upcoming analysis
 - 1,580 chloride observations used for analysis from SPW Monitoring Program dataset (sites with sparse data [N < 10] were filled in with appropriate data from WQP)

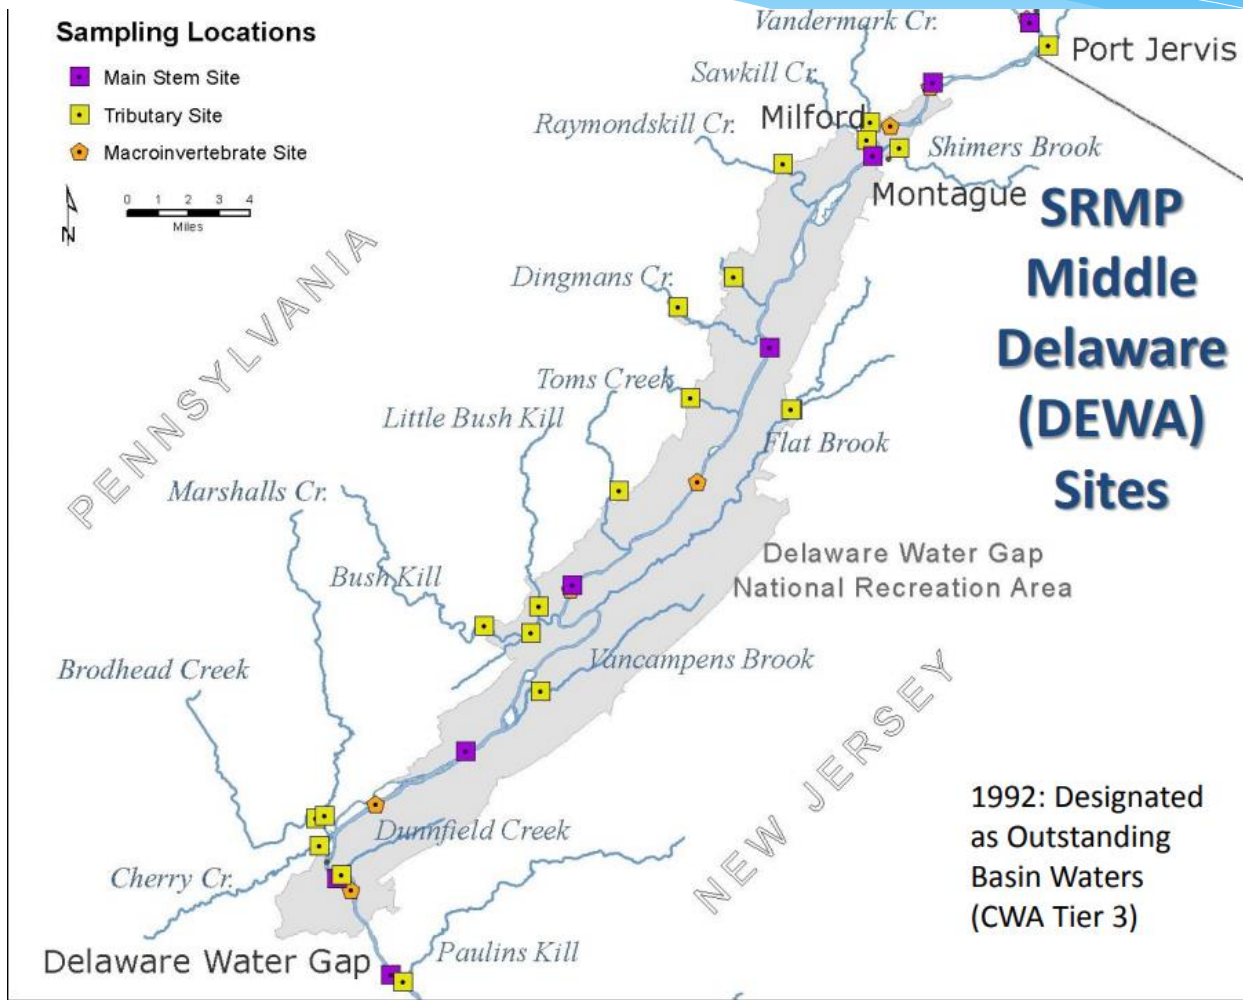

SPW Chloride Analysis

- Assessment of data and trends indicate chloride concentrations are increasing
- Are there explanatory variables that can help predict chloride levels in a sub-watershed?
- Do relatively high-chloride sites have similar characteristics vs. relatively low-chloride sites?

Boundary Control Points (Middle Delaware)

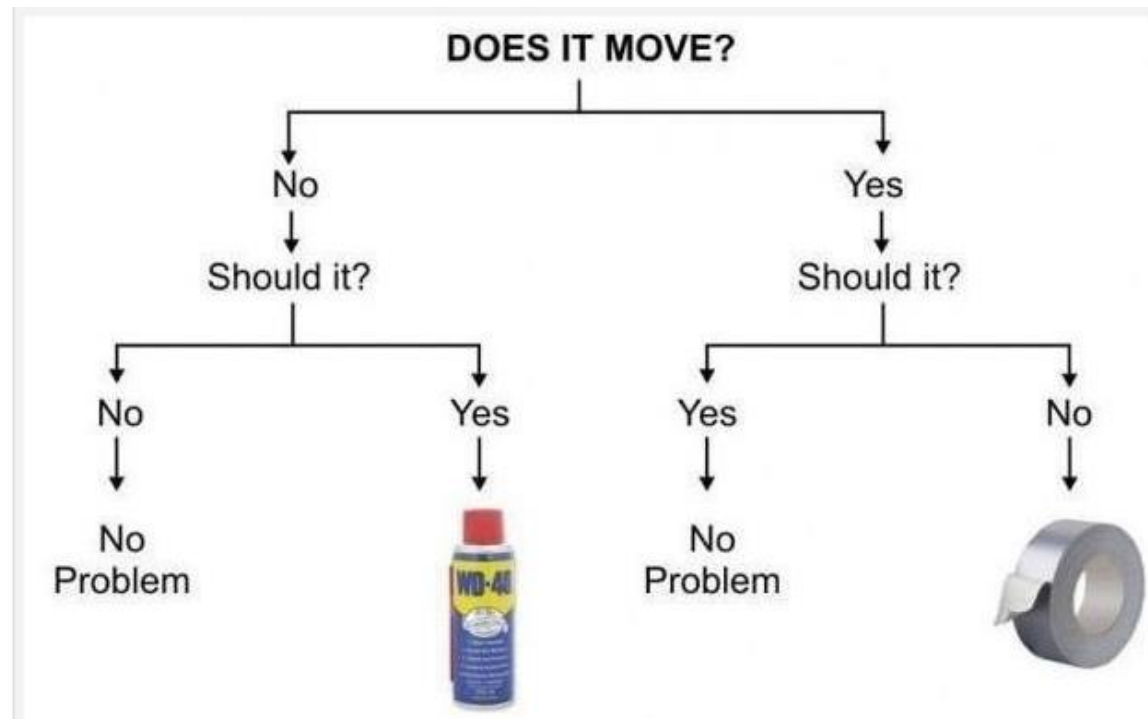

- Yellow (tributaries)
- Purple (mainstem)
- Tributaries in SPW at bottom of sub-watershed near confluence of mainstem Delaware River

Method of SPW Chloride Analysis

□ CART Analyses

□ Classification and Regression Tree

<https://eight2late.wordpress.com/2016/02/16/a-gentle-introduction-to-decision-trees-using-r/>

SPW Chloride CART Analysis

<https://www.usatoday.com/story/news/nation/2019/12/24/winter-weather-road-salt-use-problems/2741286001/>

- ❑ Use available land-use data to determine possible explanatory variables for differences in chloride levels among sub-watersheds within SPW watershed
- ❑ Road salt application largely unregulated by DOT, private contractors, and municipalities
 - ❑ Urban Area, Road Density, and Population data used as surrogates in lieu of road salt application data
- ❑ Utilized rpart data package in R Statistical Programming for CART (Classification and Regression Trees) analysis of chloride data
 - ❑ Classified chloride concentration data as a function of the above variables

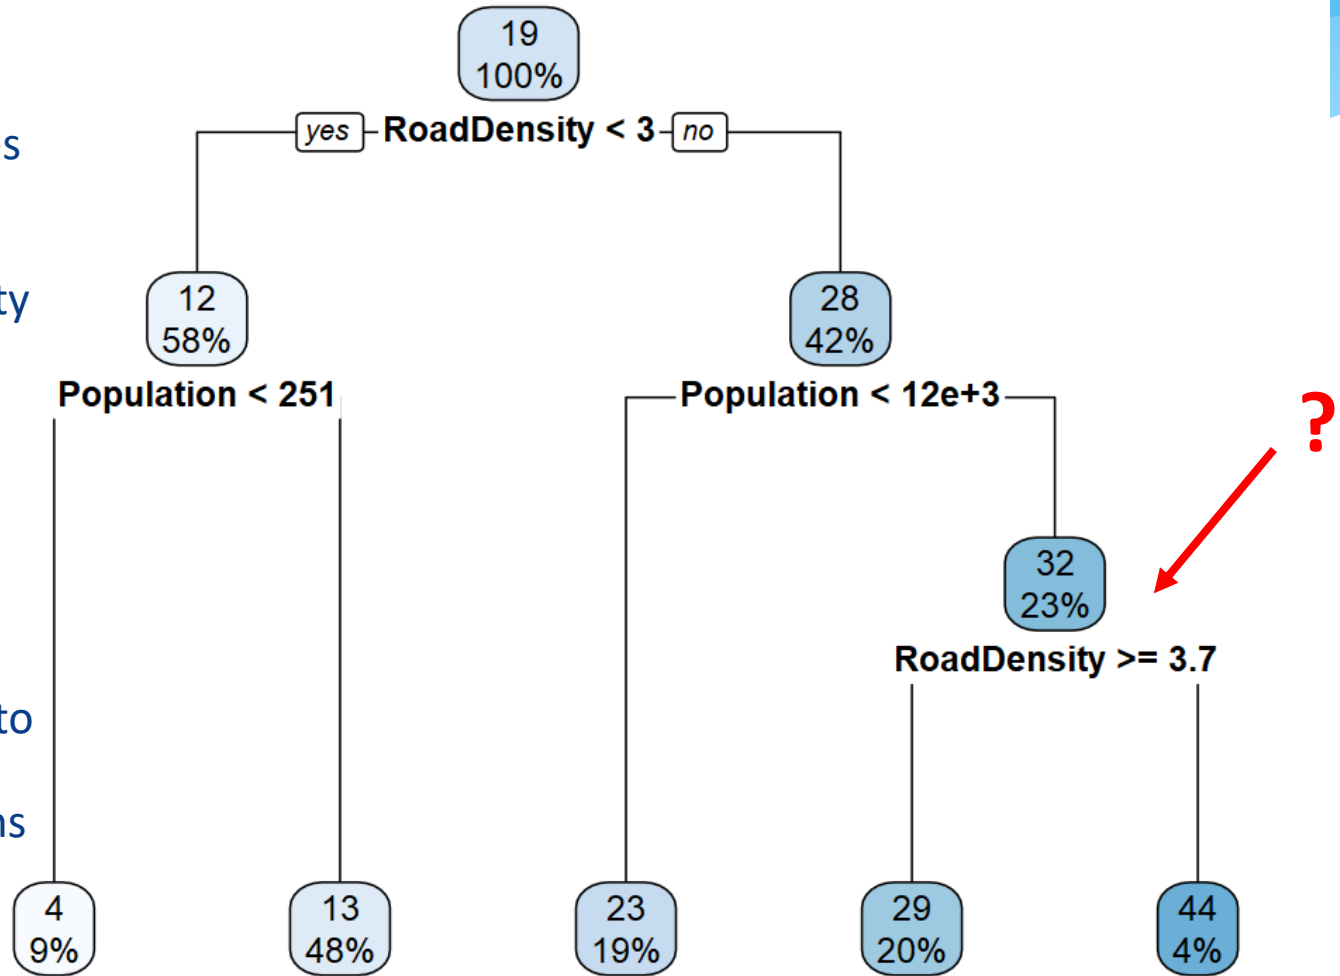

Road Density of Sub-watersheds in SPW Area vs. Median Chloride at BCPs

- Strongest R^2 with road density variable, but questions remain
 - Can sub-watersheds be categorized based on explanatory variables, and what other variables should be included? (Agricultural, forested area, point-discharge volume assessment, etc.)

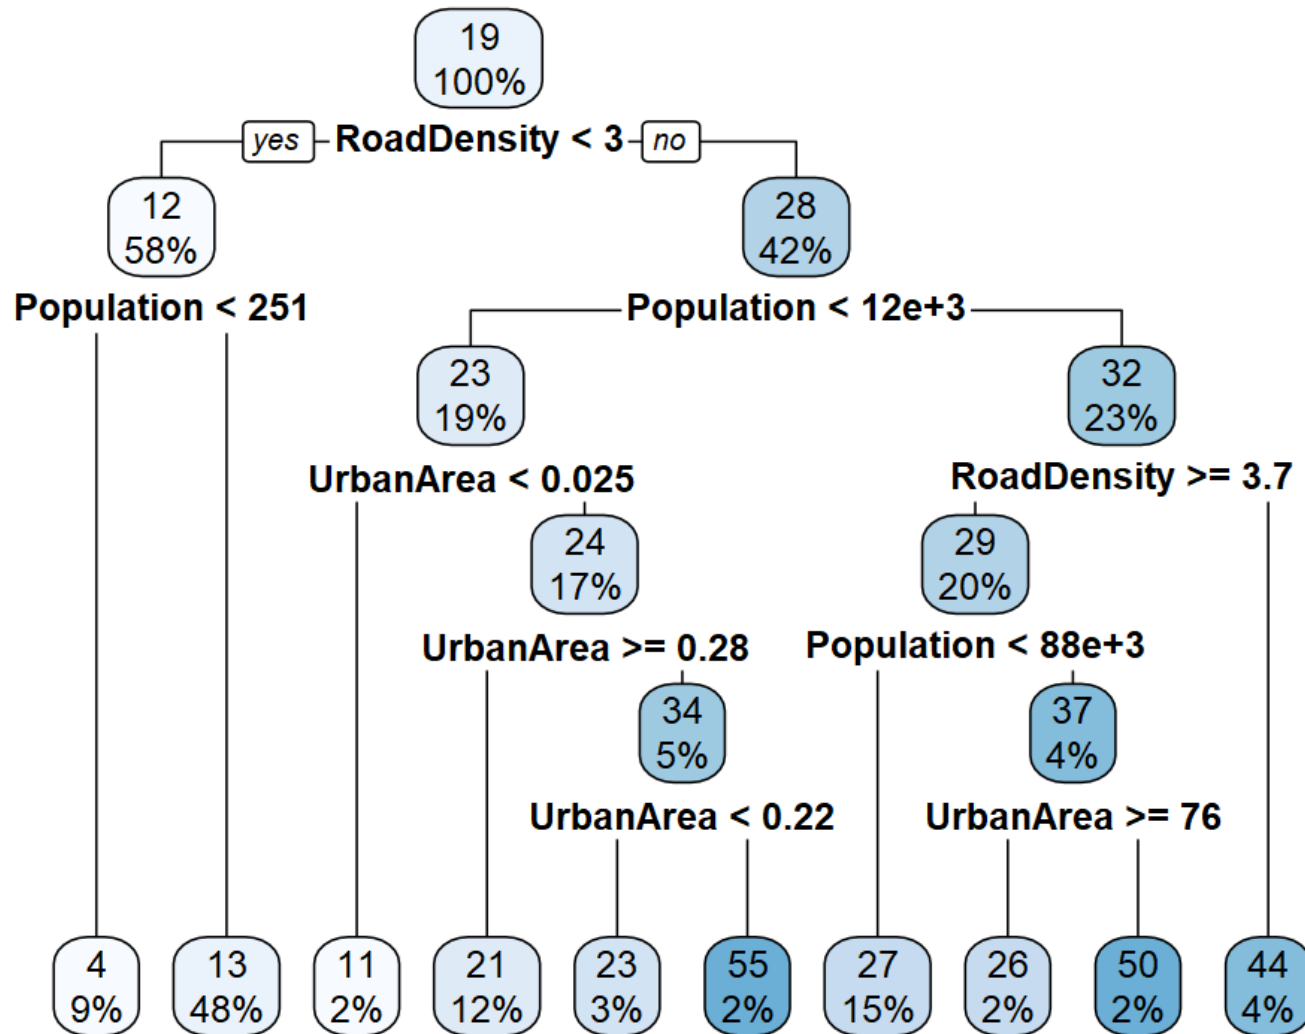

Results of CART Analyses

- Increasing chloride concentration averages seem to generally correspond with increase in road density and population
 - Urban area not incorporated in final tree
 - Far-right split may indicate further investigation of other explanatory variables to include in predicting chloride concentrations in sub-watersheds

Greater number of splits (more complicated)

DRBC Next Steps

- Further SPW sub-watershed assessment:
 - forested area
 - agricultural land area
 - point-discharge volume per sub-watershed
 - precipitation (use percentile flows to analyze seasonal effects)
- Deploy continuous conductivity loggers in SPW tributary sites/BCPs for year-round data collection with concurrent sample collection for chloride

For WQAC Group:

- Looking for suggestions for potential explanatory variables to include in CART analysis of SPW sub-watershed sites to help predict chloride concentration
- Reminder that the SPW dataset exists
 - Interested in filling spatial and temporal data gaps within this area
 - Suggestions for monitoring data to utilize/other data not uploaded to WQP?
- What other types of analyses, monitoring programs, and/or plans are occurring or being initiated in regard to the growing chloride concern?

Potential Future Action to Mitigate Chloride

- Municipality & DOT improvement plans regarding road salt application
- Continued topic of water quality committees
- Alternatives to chloride-based deicers
- Site visits and strict BMPs implemented at salt storage facilities
- Other suggestions?

Thank you!
